- Awns and Bran

In some maize varieties, especially popcorn or ornamental types, small hair-like structures called awns protrude from the husk. These aid in seed dispersal and may have a role in protection.

- Pericarp (Outer Layer)

The pericarp is the seed coat that directly envelops the kernel. It is a tough, fibrous layer that provides mechanical strength and serves as a barrier against pests and pathogens.

- Function: Protects the embryo and endosperm
- Implication: Affects milling and processing qualities

Cross-Sectional Anatomy of the Maize Grain

When viewing a diagram of maize grain with label, the internal structure reveals a layered complexity vital for understanding its nutritional and reproductive roles.
