Detailed Breakdown of the 2003 ACS Organic Chemistry Exam Answers

This section provides detailed answers to representative questions from the 2003 exam, explaining concepts step-by-step for clarity.

Question 1: Mechanism of Nucleophilic Addition to Carbonyls

Question: Describe the mechanism of nucleophilic addition to a ketone, such as acetone, and explain why the carbon atom is electrophilic.

Answer:

- Electrophilicity of the Carbonyl Carbon:

The carbon atom in a ketone's carbonyl group is electrophilic due to the polarization of the C=O bond. Oxygen, being more electronegative, pulls electron density away from the carbon, making it electron-deficient and susceptible to nucleophilic attack.

- Step-by-Step Mechanism:

- Step 1: The nucleophile (e.g., a hydride ion from NaBH₄) approaches the electrophilic carbonyl carbon.

- Step 2: The lone pair of electrons on the nucleophile forms a new bond with the carbon.

- Step 3: The C=O bond of the carbonyl breaks, and electrons shift onto the oxygen atom, creating an alkoxide ion.

- Step 4: Protonation of the alkoxide (e.g., with water or acid) yields the corresponding alcohol.

- Key Points:

- The carbonyl carbon is electrophilic because of polarization.

- The reaction proceeds via a nucleophilic addition mechanism.

- The overall process converts a ketone into an alcohol.

Question 2: Stereochemistry of Chiral Centers

Question: Determine the configuration (R or S) of the chiral center in 2-butanol.

Answer:

- Identify the Chiral Center:

The second carbon in 2-butanol is attached to:

- A hydroxyl group (-OH)
- A methyl group (-CH_3)
- An ethyl group ($\text{-CH}_2\text{CH}_3$)
- A hydrogen atom

- Assign Priorities Based on Atomic Number:

- Oxygen (from -OH): highest priority (1)
- Carbon attached to ethyl group: next (2)
- Carbon attached to methyl group: third (3)
- Hydrogen: lowest priority (4)

- Determine the Configuration:

- Orient the molecule so that the lowest priority group (hydrogen) points away.
- Trace the path from priority 1 to 2 to 3:
- If the path is clockwise, the configuration is R.
- If counterclockwise, S.

- Result:

In this case, the path from -OH (1) to $\text{-CH}_2\text{CH}_3$ (2) to -CH_3 (3) is clockwise, so the configuration is R.

Question 3: Spectroscopic Identification of Organic Compounds

Question: How can IR and NMR spectroscopy be used to identify an unknown alcohol?

Answer:

- Infrared (IR) Spectroscopy:
- Look for a broad absorption band around $3200\text{--}3600\text{ cm}^{-1}$ indicating O-H stretching.
- The intensity and broadness of this peak suggest the presence of an alcohol.

- Additional peaks may include C-H stretching near 2800-3000 cm⁻¹.
- Proton Nuclear Magnetic Resonance (¹H NMR):
 - The -OH proton often appears as a broad singlet, usually exchangeable with D₂O.
 - Characteristic chemical shifts for -CH₂- and -CH- groups adjacent to the -OH group.
 - Integration confirms the number of protons.
- Carbon-13 NMR (¹³C NMR):
 - The carbon attached to the hydroxyl group typically appears downfield (~60-80 ppm).
 - Other carbons' chemical shifts help determine the structure.

Conclusion:

By combining IR data showing the O-H stretch and NMR data indicating hydroxyl-bearing carbons, the presence and position of the alcohol functional group can be confidently identified.

Detailed Breakdown of Selected 2003 Exam Questions

Question 1: Nomenclature and Structure Drawing

Sample Question:

Given the IUPAC name 2-bromo-3-methylpentane, draw the structure and identify all chiral centers.

Analysis and Approach:

- Break down the name:
- "Pentane" indicates a five-carbon chain.
- "2-bromo" means a bromine atom attached to carbon 2.
- "3-methyl" indicates a methyl group attached to carbon 3.
- Draw the main chain: a straight chain of five carbons.
- Number from the end closest to the substituents for proper numbering.
- Attach Br to carbon 2 and CH₃ to carbon 3.
- Identify chiral centers:
- Carbon 2 has four different groups: a bromine, a hydrogen, and two different carbon chains, making it chiral.
- Carbon 3, with a methyl and other substituents, may or may not be chiral depending on the substituents.

Key Takeaway:

Understanding systematic naming facilitates accurate structure drawing, which is vital for subsequent steps like predicting reactions or stereochemistry.

Question 2: Predicting Reaction Products

Sample Question:

What is the major product when 1-bromopentane reacts with sodium methoxide in methanol?

Analysis and Approach:

- Recognize that sodium methoxide acts as a base and nucleophile.
- Determine whether an SN2 or E2 mechanism is favored:
- Primary halides generally favor SN2.
- Reaction conditions (polar protic solvents like methanol) support SN2.
- Predict the product:
- Nucleophilic substitution replaces bromine with methoxy group (-OCH₃).

Expected Answer:

1-methoxypentane

Key Takeaway:

Understanding mechanisms and conditions helps predict products accurately.
