QuestionAnswer What is the primary function of an antenna in wave propagation? An antenna converts electrical signals into electromagnetic waves for transmission and vice versa for reception. Which factor primarily affects the propagation of radio waves in free space? Frequency of the wave, as it influences propagation characteristics like wavelength and path loss. What is the typical shape of an antenna used for microwave communication? Parabolic reflector antennas are commonly used for microwave communication due to their high gain and directivity. In which propagation mode do radio waves follow the curvature of the Earth? Ground wave propagation. Which parameter determines the directivity of an antenna? The radiation pattern or directivity pattern of the antenna. What is the effect of increasing the frequency of the transmitted wave on its propagation distance? Higher frequencies generally have shorter propagation distances due to increased path loss and atmospheric absorption. Which type of wave propagation is most affected by ionospheric conditions? Sky wave propagation. What does the term 'antenna gain' refer to? The measure of how well an antenna directs radiated energy in a particular direction compared to an isotropic radiator. Which factor is crucial for vertical polarization of radio waves? The orientation of the antenna's electric field perpendicular to the ground. What is the primary advantage of using directional antennas in wave propagation? They focus energy in specific directions, increasing signal strength and reducing interference.
