In-Depth Breakdown of Selected Questions

To illustrate how the mark scheme functions, let's explore some representative questions from the 1999 paper.

Question 1: Atomic Structure and the Periodic Table

Sample Question:

Describe how the atomic structure of an element influences its position in the periodic table.

Mark Scheme Highlights:

- Correctly identifying the number of protons (atomic number).
- Relating atomic number to element identity.
- Explaining how electrons are arranged in shells.
- Connecting electron configuration to periodic trends (e.g., atomic radius, ionization energy).
- Linking the number of valence electrons to group placement.

Sample Student Answer:

An element?s atomic structure, specifically the number of protons, determines its atomic number, which in turn defines its position in the periodic table. The arrangement of electrons in shells influences its chemical properties and its position within a group or period. For example, elements in the same group have similar valence electron configurations, which explains their similar chemical behavior.

Mark Scheme Analysis:

- Full marks awarded for mentioning atomic number and electron configuration.
- Partial marks for describing general trends without explicit reference to atomic number.
- Extra credit if the student links electron arrangement to periodic trends like atomic size or reactivity.

Question 2: Chemical Bonding and Structure

Sample Question:

Explain the difference between ionic and covalent bonding, including how each affects the properties of substances.

Mark Scheme Highlights:

- Ionic bonding: transfer of electrons, formation of positive and negative ions, electrostatic attraction.
- Covalent bonding: sharing of electron pairs, formation of molecules.
- Properties: ionic compounds are typically high melting points, conduct electricity when molten or dissolved; covalent compounds often have lower melting points and do not conduct electricity.

Sample Student Answer:

Ionic bonding involves the transfer of electrons from a metal to a non-metal, creating ions that are

held together by electrostatic forces. Covalent bonding involves sharing electrons between non-metals to form molecules. Ionic compounds tend to have high melting points and conduct electricity when melted because the ions are free to move, whereas covalent compounds usually have lower melting points and do not conduct electricity.

Mark Scheme Analysis:

- Full marks given for clear explanation of electron transfer and sharing.
- Additional points for linking bonding type to physical properties.
- Common mistakes include confusion about conductance or oversimplification of bonding types.

Question 3: Organic Chemistry Reactions

Sample Question:

Describe the mechanism of the reaction between an alkene and hydrogen bromide.

Mark Scheme Highlights:

- Electrophilic addition mechanism.
- Step 1: ? bond of alkene acts as an electron pair donor, attacking the HBr molecule.
- Step 2: Formation of carbocation intermediate.
- Step 3: Bromide ion attacks carbocation, forming the addition product.
- Marking points: correct identification of the electrophile, intermediate formation, and product.

Sample Student Answer:

The alkene reacts with HBr via electrophilic addition. The ? bond electrons attack the hydrogen atom of HBr, forming a carbocation intermediate. Then, the bromide ion attacks the carbocation, giving the bromoalkane.

Mark Scheme Analysis:

- Full marks for correctly describing the electrophilic addition, carbocation intermediate, and attack of bromide.
- Partial marks for incomplete steps or incorrect terminology.

Structure of the June 2013 Mark Scheme

The OCR F325 mark scheme is meticulously structured to align with the question paper, breaking down each question into specific parts and criteria. Here's a detailed look at its typical organization:

- Question-by-Question Breakdown

Each question in the paper is associated with a corresponding mark scheme segment. The scheme identifies:

- Part Marks: Awarded for partial understanding or correct steps within a multi-part question.
- Full Marks: Given when the candidate's answer fully meets the criteria.

For example, a question asking for the identification of an unknown compound via spectroscopy might have several parts: drawing structures, explaining spectra, and justifying identification. The mark scheme clearly delineates what constitutes a correct response at each stage.

- Mark Allocation and Banding

The marks are often distributed based on:

- Accuracy of calculations

for correct responses without interpretation.

- Subjective Judgement in Explanation

For questions requiring explanations, examiners look for:

- Logical reasoning
- Correct use of terminology
- Justification of steps or conclusions

The scheme provides descriptors for different levels of response, helping examiners assign appropriate marks.

- Use of Thresholds

Certain responses need to meet minimum standards?if a candidate's answer is too vague or incomplete, they receive no marks for that part, emphasizing the importance of precise communication.

Sample Questions and Detailed Answers from the Mark Rosengarten Organic Chemistry Packet

Below are representative questions from the packet, along with comprehensive solutions to illustrate problem-solving techniques.

Question 1: Nucleophilic Substitution Mechanism (SN2)

Problem:

Predict the product of the reaction between methyl bromide (CH?Br) and hydroxide ion (OH?). Draw

the reaction mechanism.

Answer:

The reaction proceeds via an SN2 mechanism because methyl bromide is a primary halide, and hydroxide is a good nucleophile.

Step-by-step solution:

- Step 1: Identify the nucleophile and electrophile.

Nucleophile: OH?

Electrophile: CH?Br

- Step 2: Determine the mechanism.

SN2 involves a backside attack, leading to a single-step displacement.

- Step 3: Draw the mechanism:
- The hydroxide ion approaches the carbon atom bonded to bromine from the opposite side.
- As the bond between carbon and bromine breaks, the bond to hydroxide forms simultaneously.

- Step 4: Write the product.

The bromide leaves as Br?, and the hydroxide attaches to the carbon, forming methanol (CH?OH).

Final Answer:

Product: Methanol (CH?OH)

Mechanism overview: Backside nucleophilic attack leading to inversion of configuration (not applicable here since methyl is symmetrical).

Question 2: Stereochemistry - Chirality and R/S Configuration

Problem:

Assign the R or S configuration to the chiral center in 2-bentoxypropane.

Answer:

Assuming the structure is 2-bentoxypropane with the following substituents:

- Carbon 2 bonded to a bentoxy group (?O?(CH?)??CH?)
- Other substituents: two methyl groups and a hydrogen.

Step-by-step solution:

- Step 1: Identify the chiral center:

The carbon bonded to four different substituents is the chiral center.

- Step 2: Assign priorities based on atomic numbers:
- Oxygen in bentoxy group: highest priority (1)
- Carbon attached to methyl group: next (2)
- Other methyl group: (3)
- Hydrogen: lowest (4)

- Step 3: Orient the molecule so that the lowest priority group (hydrogen) points away from you.

- Step 4: Determine the order of groups 1 ? 2 ? 3:

Trace the path: from bentoxy (1) ? carbon attached to methyl (2) ? methyl group (3).

- Step 5: Determine if the sequence is clockwise or counterclockwise:

If clockwise, configuration is R; if counterclockwise, S.

- Step 6: Final assignment:

Based on the configuration, the chiral center is assigned as R or S accordingly.

Note: The exact configuration depends on the actual structure provided, but the process remains consistent.

Question 3: Spectroscopic Identification

Problem:

A compound shows IR absorption bands at 1715 cm?¹ and 3400 cm?¹. The NMR spectrum exhibits a singlet at ? 2.1 ppm and a triplet at ? 1.2 ppm. Identify the compound.

Answer:

The IR band at 1715 cm?¹ indicates a carbonyl group (C=O), typical for aldehydes, ketones, or carboxylic acids. The broad IR absorption around 3400 cm?¹ suggests O?H stretching, indicating the presence of an alcohol or acid.

The NMR signals:

- Singlet at ? 2.1 ppm suggests methyl attached to a carbonyl (acetyl group).
- Triplet at ? 1.2 ppm indicates methyl groups adjacent to a methylene.

Likely structure:

An acetyl group attached to an alcohol or acid.

Possible identity:

Acetaldehyde (but lacks the IR O?H), or more likely, ethyl acetate or acetic acid.

Considering the IR and NMR data, the compound is most consistent with acetic acid:

- IR: broad O?H stretch at 3400 cm?¹, C=O at 1715 cm?¹
- NMR: methyl singlet at ? 2.1 ppm (acetyl methyl), triplet at ? 1.2 ppm (methylene adjacent to methyl groups).

Final answer:

Acetic acid (ethanoic acid).
