and direct analysis of samples in their native state, without extensive preparation. Developed in the early 2000s, DART has revolutionized mass spectrometry by enabling real-time, in-situ analysis of solids, liquids, and gases.

The core principle involves generating a plasma or excited state gas (commonly helium or nitrogen) that interacts with the sample surface. This interaction produces ions that are subsequently transferred into a mass spectrometer for identification and quantification. The primary advantages include minimal sample preparation, rapid analysis times (often seconds), and the ability to analyze a wide range of sample types.

Why Combine DART with a Manual Mobile Platform?

The integration of DART into a portable, manual mobile platform broadens its application spectrum. The mobility facilitates on-site analysis in various settings—fieldwork, quality control in manufacturing, forensic investigations, and more. The manual nature of the platform ensures user control and adaptability, making it suitable for diverse operational environments.
