Question 1: Explain the concept of price elasticity of demand and how it impacts business pricing strategies.

Answer:

The price elasticity of demand measures how sensitive the quantity demanded of a good is to changes in its price. It is calculated as the percentage change in quantity demanded divided by the percentage change in price. If demand is elastic (elasticity > 1), a small price change leads to a significant change in quantity demanded, prompting businesses to be cautious with price increases. Conversely, if demand is inelastic (elasticity

Question 2: Using the data below, calculate the price elasticity of demand:

| Price | Quantity Demanded |

|-----|-----|

| R10 | 100 units |

| R12 | 80 units |

Solution:

First, calculate the percentage change in price and quantity demanded:

- Percentage change in price = $[(12 - 10) / 10] \times 100 = 20\%$
- Percentage change in quantity demanded = $[(80 - 100) / 100] \times 100 = -20\%$

Now, elasticity = (% change in quantity demanded) / (% change in price) = $-20\% / 20\% = -1$

The absolute value is 1, indicating unit elastic demand at this price point.
