- The regulator/rectifier has input wires from the stator and output wires to the battery and electrical system.
- Proper wiring ensures efficient charging and prevents overvoltage or undervoltage conditions.

Ignition System Wiring

The ignition system controls engine startup and operation. It includes:

- Ignition switch: allows the rider to turn the system on or off.
- Ignition coil: generates the spark for combustion.
- Kill switch: cuts power to the ignition system for safety.

The wiring diagram shows how these switches are wired in series or parallel to control the ignition circuit, often with a dedicated relay.

Lighting and Signal Systems

Lighting components include headlights, taillights, brake lights, and turn signals.

- Each light has its own wiring connection to the power supply and ground.
- Switches for lights are wired to control circuits, enabling the rider to activate or deactivate them.
- The wiring diagram details the routing, fuse protection, and switch wiring.

Starting System

The starting system includes:

- Starter relay
- Starter motor
- Battery

The wiring diagram illustrates how the ignition switch activates the relay, which in turn supplies power to the starter motor, allowing engine cranking.

Sensor and Control Modules

Sensors detect various parameters?such as engine temperature and vehicle speed?and relay signals to control modules or directly to switches and indicators.

- Wiring ensures sensor signals are transmitted accurately.
- Proper grounding and shielding are critical to prevent false readings or electrical noise.
