Basic Practice of Statistics Answer Key

Understanding the fundamental concepts of statistics is essential for interpreting data accurately and making informed decisions. The basic practice of statistics answer key serves as a vital resource for students, educators, and professionals seeking to reinforce their grasp of core statistical principles. This comprehensive guide aims to elucidate key topics in statistics, provide practice questions with solutions, and offer strategies to excel in statistical analysis.

Introduction to Basic Statistics

Statistics is the branch of mathematics dealing with data collection, analysis, interpretation, presentation, and organization. It provides tools to understand variability, identify patterns, and make predictions based on data.

Key Objectives of Basic Statistics Practice:

- Understand types of data and measurement scales
- Calculate and interpret measures of central tendency
- Calculate and interpret measures of dispersion
- Understand probability concepts
- Conduct basic inferential statistics

Types of Data and Measurement Scales

Before diving into statistical calculations, it is essential to understand the nature of data.

Types of Data

- Qualitative (Categorical) Data: Descriptive data that can be categorized (e.g., gender, color)
- Quantitative Data: Numerical data representing measurable quantities
- Discrete Data: Countable (e.g., number of students)
- Continuous Data: Measurable on a continuum (e.g., height, weight)

Measurement Scales

- Nominal Scale: Categorizes data without any order (e.g., blood type)
- Ordinal Scale: Categorizes data with an order but no fixed interval (e.g., rankings)
- Interval Scale: Numeric data with equal intervals, no true zero (e.g., temperature in Celsius)
- Ratio Scale: Numeric data with a true zero point (e.g., income, height)

Measures of Central Tendency

These measures describe the center point of a data set.

Mean (Average)

\[

$$\text{Mean} = \frac{\sum_{i=1}^n x_i}{n}$$

\]

Where:

- (x_i) = each data point
- (n) = total number of data points

Practice Question:

Calculate the mean of the data set: 4, 8, 6, 10, 12.

Answer:

\[

$$\text{Mean} = \frac{4 + 8 + 6 + 10 + 12}{5} = \frac{40}{5} = 8$$

\]

Median

The middle value when data is ordered. If the data set has an even number of observations, the

median is the average of the two middle numbers.

Practice Question:

Find the median of: 3, 7, 9, 2, 5.

Answer:

Ordered data: 2, 3, 5, 7, 9

Median: 5

Mode

The value that appears most frequently in the data set.

Practice Question:

Identify the mode of: 2, 4, 4, 6, 7, 4, 8.

Answer:

Mode: 4 (appears three times)

Measures of Dispersion

These describe how spread out the data points are.

Range

\[

$$\text{Range} = \text{Maximum} - \text{Minimum}$$

\]

Practice Question:

Find the range of: 15, 22, 9, 18, 27.

Answer:

$$\text{Range} = 27 - 9 = 18$$

Variance and Standard Deviation

Variance measures the average squared deviation from the mean. Standard deviation is the square root of variance and provides dispersion in original units.

Sample Variance Formula:

$$\backslash[$$

$$s^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n - 1}$$

$$\backslash]$$

Sample Standard Deviation:

$$\backslash[$$

$$s = \sqrt{s^2}$$

$$\backslash]$$

Practice Question:

Calculate the standard deviation of the data set: 5, 7, 8, 9, 10.

Answer:

Step 1: Find mean $(\bar{x} = (5+7+8+9+10)/5 = 39/5 = 7.8)$

Step 2: Compute squared deviations and sum them:

$$\backslash[$$

$$(5-7.8)^2 = 7.84 \backslash\backslash$$

$$(7-7.8)^2 = 0.64 \backslash\backslash$$

$$(8-7.8)^2 = 0.04 \backslash\backslash$$

$$(9-7.8)^2 = 1.44$$

$$(10-7.8)^2 = 4.84$$

]

$$\text{Sum} = 7.84 + 0.64 + 0.04 + 1.44 + 4.84 = 14.8$$

Step 3: Variance:

[

$$s^2 = \frac{14.8}{4} = 3.7$$

]

Step 4: Standard deviation:

[

$$s = \sqrt{3.7} \approx 1.92$$

]

Probability Concepts

Probability measures the likelihood of an event occurring.

Basic Probability Rules

- Probability of an event (A) :

[

$$P(A) = \frac{\text{Number of favorable outcomes}}{\text{Total outcomes}}$$

]

- Addition Rule: For mutually exclusive events (A) and (B) ,

[

$$P(A \cup B) = P(A) + P(B)$$

]

- Multiplication Rule: For independent events (A) and (B) ,

[

$$P(A \cap B) = P(A) \times P(B)$$

]

Practice Question:

If a die is rolled, what is the probability of rolling a 3 or a 5?

Answer:

[

$$P(3) = \frac{1}{6}$$

$$P(5) = \frac{1}{6}$$

$$P(3 \cup 5) = \frac{1}{6} + \frac{1}{6} = \frac{2}{6} = \frac{1}{3}$$

]

Introduction to Inferential Statistics

Inferential statistics uses data from a sample to make generalizations about a population.

Sampling and Sampling Distributions

- Sampling: Selecting a subset of individuals from a population
- Sampling Distribution: Distribution of a statistic (like mean) over many samples

Hypothesis Testing

A method to test assumptions about a population parameter.

Steps in Hypothesis Testing:

- State null (H_0) and alternative (H_1) hypotheses
- Choose significance level (α)
- Calculate test statistic
- Determine p-value or critical value
- Make a decision to reject or fail to reject H_0

Common Tests:

- Z-test
- T-test
- Chi-square test

Practice Question:

A sample mean of 52 is obtained from a sample size of 30, with a population standard deviation of 10. Test at $(\alpha=0.05)$ if the population mean is 50.

Answer:

Step 1: Null hypothesis: $H_0: \mu = 50$

Step 2: Calculate Z:

[

$$Z = \frac{\bar{x} - \mu_0}{\sigma / \sqrt{n}} = \frac{52 - 50}{10 / \sqrt{30}} \approx \frac{2}{1.825} \approx 1.096$$

]

Step 3: Critical Z at $(\alpha=0.05)$: approximately ± 1.96

Since 1.096
