Sample Microbiology Lab Manual Answer Breakdown

Let's analyze an example question to illustrate how to construct a comprehensive answer.

Question: Describe the Gram staining procedure and explain how it differentiates bacteria.

Answer Breakdown:

- Preparation of a Bacterial Smear

- Use a sterile loop to transfer a small amount of bacterial culture onto a clean slide.
- Spread the bacteria into a thin film.
- Air dry the smear and heat fix by passing the slide through a flame to adhere bacteria to the slide.

- Staining Process

- Crystal Violet (primary stain): Cover the smear and let sit for about 1 minute; rinse with water.
- Iodine (mordant): Apply iodine solution to form a complex with crystal violet; wait for 1 minute; rinse.
- Decolorization: Use alcohol or acetone briefly to wash out the stain from Gram-negative

bacteria; rinse immediately.
- Counterstain (Safranin): Apply safranin for 30 seconds; rinse and blot dry.

- Microscopic Examination

- Observe under oil immersion.
- Gram-positive bacteria: Retain the purple crystal violet stain due to thick peptidoglycan layer.
- Gram-negative bacteria: Take up the safranin counterstain and appear pink/red with a thinner peptidoglycan layer.

- Explanation of Differentiation

- The procedure exploits differences in cell wall structure:
- Gram-positive bacteria have a thick peptidoglycan layer that traps the crystal violet-iodine complex.
- Gram-negative bacteria have a thinner peptidoglycan layer and an outer membrane, which gets washed away during decolorization, allowing the counterstain to color the bacteria.

Ensuring Accuracy in Your Lab Manual Answers
