- **Random Vibration:** Represents unpredictable vibrational forces, such as those encountered during transport or in certain operational environments. The test applies a spectrum of frequencies with specified power spectral density.
- **Vibration Duration:** The standard details the duration for each test cycle, typically ranging from a few hours to several days, depending on the equipment's application.

Test Parameters and Conditions

Key parameters include:

- **Frequency Range:** Usually from 10 Hz to 150 Hz, but can vary based on equipment.
- **Amplitude:** The maximum displacement or acceleration applied during testing.
- **Resonance Checks:** The standard emphasizes identifying and addressing resonance phenomena that could amplify vibrations and cause damage.
- **Mounting Conditions:** Equipment is mounted on fixtures that replicate mounting conditions in the field, ensuring test validity.

Testing Procedures According to IEC 68 2 60

Preparation for Testing

Before conducting vibration tests, proper preparation is essential:

- **Visual Inspection:** Check for physical damage, loose components, or manufacturing defects.
- **Mounting Setup:** Secure the device on a vibration table or shaker that mimics the mounting conditions in actual use.
- **Baseline Measurements:** Record initial operational parameters to compare post-test performance.

Conducting the Vibration Tests

The testing process involves:

- Applying sine or random vibrations as per the test plan.
- Monitoring the equipment during testing for abnormal behavior or signs of distress.
- Recording parameters such as acceleration, displacement, and resonant frequencies.

Post-Test Evaluation

After completing the vibration cycles:

- Inspect the equipment for physical damage, loosening of components, or structural failures.
- Test the operational functionality to ensure performance standards are maintained.
- Compare results against acceptance criteria specified in IEC 68 2 60.

Failure to meet criteria may lead to design modifications, improved mounting methods, or enhanced component robustness.
