What is PID Control?

PID control involves continuously calculating an error value as the difference between a desired setpoint and a measured process variable. The controller then applies correction based on proportional, integral, and derivative terms, each contributing to the overall control signal:

- Proportional (P): Corrects the error proportionally.
- Integral (I): Eliminates residual steady-state error by integrating over time.
- Derivative (D): Predicts future error based on its rate of change, improving stability.

This combination allows for precise and stable control of processes such as temperature, flow, pressure, and level.

Configuring PID on the MicroLogix 1400

Prerequisites and Hardware Setup

Before configuring PID control, ensure you have:

- A MicroLogix 1400 PLC
- Programming software (RSLogix 5000 or Connected Components Workbench)
